### **DETAILED ACTION**

This is the first action relating to serial application number 10/520,852 filed 09-06-2005.

Claims 1-5 are currently pending.

#### ***Priority***

1. Receipt is acknowledged of papers submitted under 35 U.S.C. 119(a)-(d), which papers have been placed of record in the file.

#### ***Drawings***

2. The examiner has accepted the drawing filed with this application as formal drawing.

#### ***Claim Rejections - 35 USC § 103***

3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

4. Claims 1-5 are rejected under 35 U.S.C. 103(a) as being unpatentable over JP (2001-200857) in view of Ishiguro (5,133,609). JP (2001-200857) discloses the claimed invention including the seal ring that seals both ends of an internal space between the inner circumferential surface of the outer ring (4) and the outer circumferential surface of the inner ring (3) and wherein each of the seal rings includes a plurality of projections (16/18/19/21) circumferentially on an inside surface at a portion near the inner circumference of the seal ring such that a tip edge of at least one of the pluralities protrusions (18) comes in sliding contact with the corresponding axial end surface of the

Art Unit: 3682

inner ring. JP (2001-200857) does not disclose that the bearing is a double row ball bearing, and the axial width of the bearing does not exceed 45% an inner diameter of the inner ring and the width in the radial direction of an overlap section is at least 25% a diameter on one of the plurality of balls. Ishiguro discloses a double bearing with a seal at both ends of the inner and outer rings. Therefore, it would have been obvious to one of ordinary skills in the art at the time of the invention to modify the bearing of JP (2001-200857) so that it is a double row bearing in view of Ishiguro in order to increase load capacity. In addition, it would have been obvious to one of ordinary skill in the art at the time of the invention to modify the device of JP (2001-200857) to obtain the values as claimed, since it has been held that where the general conditions of a claim is disclosed in the prior art, discovering the optimum ranges involves only routine skill in the art. *In re Aller*, 105 USPQ 233.

Regarding claim 2, additionally, it is apparent that a labyrinth seals are formed.
